Sitecore Experience Commerce 10.3 Release Notes

December 2, 2022 – Released Sitecore Experience Commerce 10.3.

June 12, 2023 – added a known issue to this document (ref: 587933)

Sitecore Experience Commerce 10.3 is a maintenance release comprising bug fixes and providing compatibility with Sitecore Experience Platform and dependent third parties.

Improvements

Area	Improvements	ID
Compatibility	Compatible with the Sitecore 10.3 stack:	
	SXP 10.3	
	SXA 10.3	
	PowerShell Extensions 6.4	
	Sitecore Identity 7.0	
	Sitecore.ContentSearch.SolrProvider 10.1	
Compatibility	Added compatibility to latest third party software versions:	
	Windows Server 2022	
	Windows 11	
	Visual Studio 2022	
	.NET 6.0	
	Application Insights 2.20	
	Solr 8.11.2	
	Braintree payment provider .NET Library 5	
	Knockout library 3.5.0	
	IdentityModel 3.10.10	

Resolved Issues

Area	Resolved Issues	ID
Indexing	Resolved an intermittent issue where Solr indexing can fail in certain situations, if	528940
	GetSolrIndexOperations() is called before indexes are properly	
	initialized.	
	This fix was also delivered as a hotfix for XC 10.0.	
Indexing	Resolved an issue where a solr server error or connection loss does not correctly	552849
	result in the Sitecore.Commerce.Plugin.Search.FullIndexMinion	
	stopping its processing, which results in no data being indexed and a failure to	
	search correctly.	
	This fix was also delivered as a hotfix for XC 10.0.	

Area	Resolved Issues	ID
Indexing	Resolved an issue where Sitecore master indexing and switch-on-rebuild	556894
	processing would continue even when an error occurred in commerce catalog	
	indexing, which resulted in search for catalog items being unusable.	
	This fix was also delivered as a hotfix for XC 10.0.	
Promotions	Resolved a cart calculation issue in a scenario where after a product had been	554021
	removed from the cart, a free gift promotion was not correctly removed.	
	This fix was also delivered as a hotfix for XC 10.0.	
Inventory	Resolved an invalid operation exception when running a	501030
	GetBulkStockInformation request on a product ID that does not exist in	
	the database.	
	This fix was also delivered as hotfixes for XC 10.1 and XC 10.2.	
Import/Export	Resolved an issue where the re-import of an exported catalog did not correctly	557187
	associate categories to the catalog. The issue was that obsolete versioning code	
	was interfering, after having removed the versioning of catalog relationships in a	
	previous release.	
Performance	Allowed the ValidateShopBlock to have for more than one shop on the global	560451
	context, so that lookups do not need to continually make calls to fetch the entity.	
Deployment	Moved the storage location of language files, to make it easier for developers to	507436
	handle their own custom language files across an upgrade. Moved the language	
	files from engine.connect.items.master/web.dat to new separate	
	item resource files:	
	\Content\Website\sitecore modules\items\master\	
	engine.connect.languages.items.master.dat	
	\Content\Website\sitecore modules\items\web\	
	engine.connect.languages.items.web.dat	
	In the scenario where developers have their own custom language files stored in	
	the same location as the Sitecore default files but have different Sitecore IDs, this	
	change allows developers to remove or delete the default files during an upgrade.	
	This fix was also delivered as a hotfix for XC 10.2.	
Deployment	Corrected a deployment issue causing Sitecore's Workbox to function incorrectly.	513305
	The problem was that XC's CatalogProvider was patched in to the	
	Sitecore.Commerce.Engine.DataProvider.config file ahead of	
	Sitecore's default Data Provider, which resulted in Workbox trying to reference	
	the Catalog Provider instead of its own default Data Provider and not being able to	
	find the expected items.	
	This fix was also delivered as a hotfix for XC 10.1.	

Known Issues

Area	Known Issues	ID
Publishing a single	A specific scenario of publishing is unnecessarily slow. Scenario: Publish	587933
content item	Item, Smart publish, Publish Subitems enabled. Starting in 10.3 this	
	combination of publish settings can trigger the item's descendants to be	
	accessed as part of its evaluation process, which can unnecessarily access	

Area	Known Issues	ID
	descendant catalog items and make calls to the Commerce Engine (even	
	though there are no deltas to publish).	
	To resolve this specific scenario, a developer could implement an override	
	(in various ways) that prevents the catalog tree from being walked.	
	Note that the Publish Site (full publish) scenario is not impacted by this	
	issue.	
Sample BrainTree	Using the sample XC Storefront website, an error occurs in a scenario where	539676
payment provider	the user is re-validating a payment. For example, proceed through the	
plugin	checkout process including the validate payment step; then go back and	
	add another product to the cart and repeat the checkout process. The	
	result is the sample BrainTree plugin fails. To resolve, ensure your	
	implementation of a BrainTree payment integration uses supported	
	BrainTree UI js code.	

Removed and Obsoleted Code

Area	Removed or Deprecated	ID
	[none]	

Breaking Changes

Area	Breaking Changes	ID
Compatibility	.NET Core 3.1 replaced by .NET 6	
Compatibility	A minor policy change, associated with Solr upgrade to Solr 8.11.2	

Note: the Commerce database schema has not changed in XC10.3, so no database upgrade from 10.2 to 10.3 is required.
