# Install and configure Horizon 10.2

This guide tells you how to install Sitecore Horizon on-prem.

## Prerequisites

Before you install Sitecore Horizon, you must:

- Install Sitecore Experience Platform 10.2.
- Ensure that your Sitecore Content Management (CM) site is accessible with the `https` protocol.
- [Enable support for the WebSocket Protocol](#) in Windows Server Manager.
- Ensure Sitecore Identity is installed.

You must also install the following tools on the server where you plan to install Horizon:

- [Sitecore Installation Framework \(SIF\) 2.3.0](#)
- [ASP.NET Core/.NET Core: Runtime & Hosting Bundle 3.1.15 x64](#)

After you install the tools, restart your machine.

## SameSite cookies and custom domains

The companies that create commonly-used browsers such as Chrome and Safari are changing how the browsers interpret the [SameSite cookie attribute](#). After the change takes effect, Horizon only works if the Sitecore Horizon host instance, the Sitecore identity instance, and the Sitecore Content Management (CM) instance belong to the same site. (For more information about SameSite cookies, read [this article](#).) We recommend that you assign custom domains to the Sitecore Horizon host and Sitecore identity instances.

The following are examples of valid configuration:

### *Example 1*

Sitecore CM: `https://cm.mycompany.com`

Sitecore identity: `https://si.mycompany.com`

Horizon: `https://horizon.mycompany.com`

### *Example 2*

Sitecore CM: `https://cmdomain.com`

Sitecore identity: `https://si.cmdomain.com`

Horizon: `Horizon.cmdomain.com`

## Prerequisites to integrate Content Hub with Horizon

To work with Content Hub media in Horizon, you must:

- Deploy and configure Sitecore Content Hub and install Sitecore Connect™ for Content Hub. (Compatible versions are listed [here](#).)
- Enable content Hub integration for Horizon during Horizon installation (see the Install Horizon section).

- Configure the CORS settings for Sitecore DAM.

## Prerequisites to integrate Sitecore Experience Accelerator (SXA) with Horizon

To work with SXA in Horizon, you must:

- Install and configure the appropriate version of the [Sitecore Experience Accelerator](#) module.
- Enable SXA module integration for Horizon during Horizon installation (see the Install Horizon section).

## Get Sitecore Horizon installation files

To get the Horizon installation files:

- Download the Horizon installation .zip file (`Sitecore Horizon 10.2.0.zip`) and unpack it.

## Install Horizon

To install Horizon:

1. In the `InstallHorizon.ps1` file, specify the following parameters:

Parameter name	Information to enter
<code>horizonInstanceName</code>	<p>The name of the Horizon website.</p> <p>The Horizon instance name can only contain:</p> <ul style="list-style-type: none"> <li>• Alphanumeric characters (A-Z, a-z, 0-9)</li> <li>• Minus (-)</li> <li>• Period (.)</li> </ul> <p>Periods can only be used to delimit the components of domain style names.</p>
<code>horizonAppUrl</code>	<p>The Horizon site URL including web protocol.</p> <p>Due to the SameSite cookie attribute changes, we recommend that you set the Horizon website as a subdomain of the Sitecore Content Management instance. For example, if the Sitecore CM instance has the address: <code>https://cmdomain.com</code>, then set this parameter to: <code>https://horizon.cmdomain.com</code></p>
<code>horizonPhysicalPath</code>	<p>The physical path where you expect Horizon to be installed. For example, <code>C:\inetpub\wwwroot\horizon.</code></p>

Parameter name	Information to enter
<code>sitecoreCmInstanceName</code>	The name of the Sitecore Content Management instance.
<code>sitecoreAdminPassword</code>	The password of the admin user of the Sitecore Content Management instance.
<code>sitecoreCmInstancePath</code>	The physical path of the Sitecore Content Management instance.
<code>sitecoreCmInstanceUrl</code>	The content management site URL including web protocol that is used to access the content management site (for example, <code>https://cmdomain.com</code> ).
<code>sitecoreCmInstanceInternalUrl</code>	The content management site URL including web protocol that is used to access the content management site internally by Horizon service (for example, <code>http://cmdomain.com</code> ). It can differ from <code>sitecoreCmInstanceUrl</code> if Sitecore is installed with containers.
<code>identityServerUrl</code>	The Sitecore Identity server site URL including web protocol (for example, <code>https://identity.cmdomain.com</code> ).
<code>identityServerPoolName</code>	The Sitecore Identity server pool name.
<code>identityServerPhysicalPath</code>	The physical path of the Sitecore Identity server.
<code>solrCorePrefix</code>	The prefix of the Sitecore Solr core index for Horizon. Make sure it is aligned with the prefix for the <code>sitecore_master_index</code> from your current deployment.
<code>licensePath</code>	The Sitecore license file location, including the file name. For example, <code>C:\Project\Files\license.xml</code>
<code>enableContentHub</code>	<p>Set to <code>\$true</code> to enable ContentHub integration with Horizon on the deployed Sitecore instance, or <code>\$false</code> to disable the integration.</p> <p>If set to <code>\$true</code>, it enables the Sitecore <code>/Plugins/Filters/ContentHub</code> node in the <code>sitecorehost.xml</code> file, in the Horizon site physical path.</p>
<code>enableSXA</code>	Set to <code>\$true</code> to enable SXA module integration with Horizon on the installed Sitecore instance, or <code>\$false</code> to disable the integration.

Parameter name	Information to enter
topology	The topology type of the deployed Sitecore instance (can be set to either XP or XM)

- In Windows, launch PowerShell as an administrator.
- In a PowerShell command line, run the `InstallHorizon.ps1` cmdlet.

When installation is finished, you can access the Horizon website using the name specified in the `horizonAppUrl` parameter in the `InstallHorizon.ps1` file.

## Update the style sheet

Before you can use the alignment and indentation features in the rich text editor in Horizon, you must define some styles in your style sheet.

To enable alignment and indentation in the rich text editor:

- Add the following lines to your default style sheet:

```
.rte-indent-1 {
  padding-left: 40px;
}
.rte-indent-2 {
  padding-left: 80px;
}
.rte-indent-3 {
  padding-left: 120px;
}
.rte-indent-4 {
  padding-left: 160px;
}
.rte-indent-5 {
  padding-left: 200px;
}
.rte-indent-6 {
  padding-left: 240px;
}
.rte-indent-7 {
  padding-left: 280px;
}
.rte-indent-8 {
  padding-left: 320px;
}

.rte-align-center {
  text-align: center;
}
.rte-align-justify {
  text-align: justify;
}
.rte-align-right {
  text-align: right;
}
```

## Install and enable Content Hub after installing Horizon

If you did not install Sitecore Content Hub before you installed Horizon, you can enable Sitecore Content Hub integration for Horizon after you install both Horizon and Content Hub.

To enable Content Hub integration after installing Horizon:

1. Make sure you have installed and configured Sitecore Content Hub and Sitecore Connect™ for Content Hub.
1. Open the `sitecorehost.xml` file, which is in the root folder of the Sitecore Horizon site physical path.
2. In the Plugins section, uncomment the `<ContentHub>+ContentHub</ContentHub>` line.
3. Delete the `<ContentHub>-ContentHub</ContentHub>` line if it exists. The result looks like this:

```
<Plugins>
  <Filters>
    <ExplicitEnablement>-ExplicitEnablement</ExplicitEnablement>

    <!-- Uncomment the line below to enable ContentHub plugin -->
    <ContentHub>+ContentHub</ContentHub>
  </Filters>
</Plugins>
```

## Configure the CORS settings for Sitecore DAM

If you have enabled integration with Content Hub, you must add the Horizon site URL to the CORS settings for your Sitecore DAM™ instance.

To update the CORS settings for your Sitecore DAM instance:

- In the Sitecore Connect™ for Content Hub documentation, follow the steps in the CORS configuration section, but add the Sitecore Horizon site URL instead of the Sitecore instance URL.

## Install and enable SXA after installing Horizon

If you did not install SXA before you installed Horizon, you can enable SXA integration with Horizon after you install both Horizon and SXA.

To enable SXA integration after installing Horizon:

1. Make sure you have installed and configured SXA and all its prerequisites.
2. Open the `sitecorehost.xml` file, which is in the root folder of the Sitecore Horizon site physical path.
3. In the Plugins section, uncomment the `<ExperienceAccelerator>+SXA</ExperienceAccelerator>` line.
4. Delete the `<ExperienceAccelerator>-SXA</ExperienceAccelerator>` line if it exists.

The result looks like this:

```
<Plugins>
  <Filters>
    <ExplicitEnablement>-ExplicitEnablement</ExplicitEnablement>

    <!-- Uncomment the line below to enable SXA plugin -->
    <ExperienceAccelerator>+SXA</ExperienceAccelerator>
  </Filters>
</Plugins>
```

5. Restart Horizon website in IIS.

Now you can work with SXA pages and controls in the Horizon application.

## Prepare the Solr search engine

For the search feature to work in Horizon, after you deploy Horizon, you must populate the Solr managed schema and build the Horizon index.

To prepare the Solr search engine for Horizon:

1. Log into Sitecore.
2. On the Sitecore Launchpad, click **Control Panel**.
3. In the **Indexing** section, click **Populate Solr Managed Schema**.
4. In the **Schema Populate** dialog box, ensure that the **sitecore\_horizon\_index** and the **sitecore\_master\_index** checkboxes are selected.
5. Click **Populate**.
6. When the **Schema Populate** dialog box indicates that the indexes have been populated successfully, click **Close**.
7. On the **Control Panel**, in the **Indexing** section, click **Indexing Manager**.
8. In the **Indexing Manager** dialog box, select the **sitecore\_horizon\_index** and the **sitecore\_master\_index** checkboxes and then click **Rebuild**.
9. When the search indexes have been rebuilt, click **Close**.

## Troubleshooting Horizon Search

If Horizon Search does not work, repeat the steps above, except after step 6, restart the CM instance before continuing to step 7.
