Introduction

The purpose of this plugin is to enable Sitecore users to embed their digital assets from Sitecore DAM™ into the CMS solution.

Note

- This plugin has been tested on **Sitecore Experience Manager** and **Sitecore Experience Platform** (versions 8.27, 9.02 and 9.1.0), as well as **Sitecore Experience Commerce** (versions 9.0.2 and 9.0.3).
- This plugin is entirely localizable (only English resources are provided out-of-the-box).
- This plugin does not support the Sitecore Experience Accelerator (SXA) or the asset upload from Sitecore.

Plugin installation

The plugin requires a configuration in both Sitecore DAM™ and Sitecore instances, as detailed in the following chapters.

Sitecore DAM™ configuration

The following configurations need to be applied on a 3.1.x version instance of Sitecore DAM™. It is preferable to use the latest 3.1.x version.

OAuth Configuration

First, we need to allow the Sitecore instance to authenticate against Sitecore DAM™ by setting up an OAuth client. The following steps describe the OAuth client configuration.

1. Go to **Manage** (Main menu item).
2. Click on the **OAuth client** icon.
3. Create a new **OAuth Client** item.
4. Fill in the client fields as shown in the following image:

New OAuth Client

Name *

localSitecore

Client ID *

Client_id

Client Secret *

Client_secret

Redirect Url *

http://sitecore_instance/sitecore/client/S

CREATE

CANCEL

Note: The redirect URL should be in the following format:

https://{custom_sitecore_host_url}/sitecore/client/stylelabs/mapp

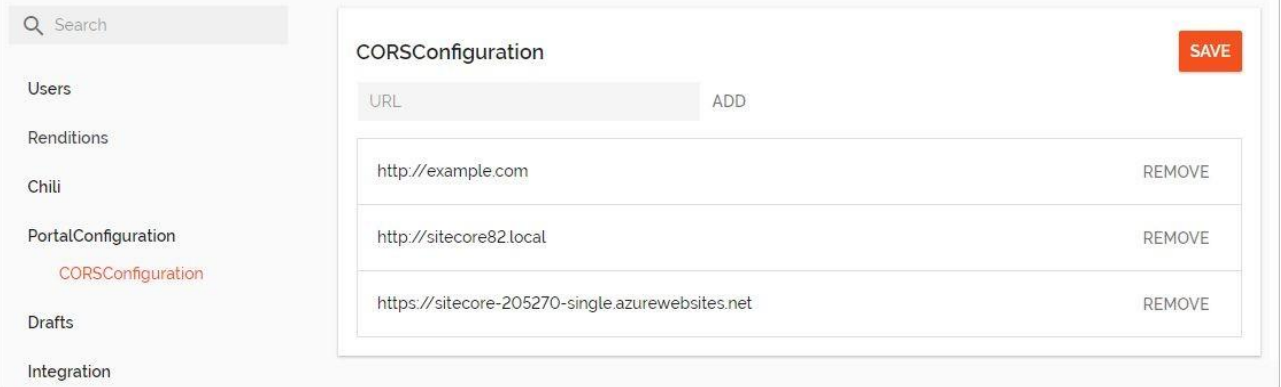

5. Save the changes.

CORS configuration

We also need to configure CORS for Sitecore DAM™ to allow incoming traffic from the Sitecore instance. The following steps describe the CORS configuration.

1. Go to **Manage** (main menu item).
2. Click on the **Settings** item.
3. In the **Settings** page, click on the **PortalConfiguration** menu item.
4. Click on **CORSConfiguration** under the **PortalConfiguration** menu item.
5. Add the Sitecore instance URL to the list of URLs (e.g. https://www.sitecore_instance.net).
6. Save the changes.

Settings

The screenshot shows the Sitecore Settings interface for CORSConfiguration. On the left is a navigation menu with options: Users, Renditions, Chili, PortalConfiguration, CORSConfiguration (highlighted), Drafts, and Integration. The main area is titled 'CORSConfiguration' and features a search bar, an 'ADD' button, and a table of configured URLs. A red 'SAVE' button is in the top right corner.

URL	
http://example.com	REMOVE
http://sitecore82.local	REMOVE
https://sitecore-205270-single.azurewebsites.net	REMOVE

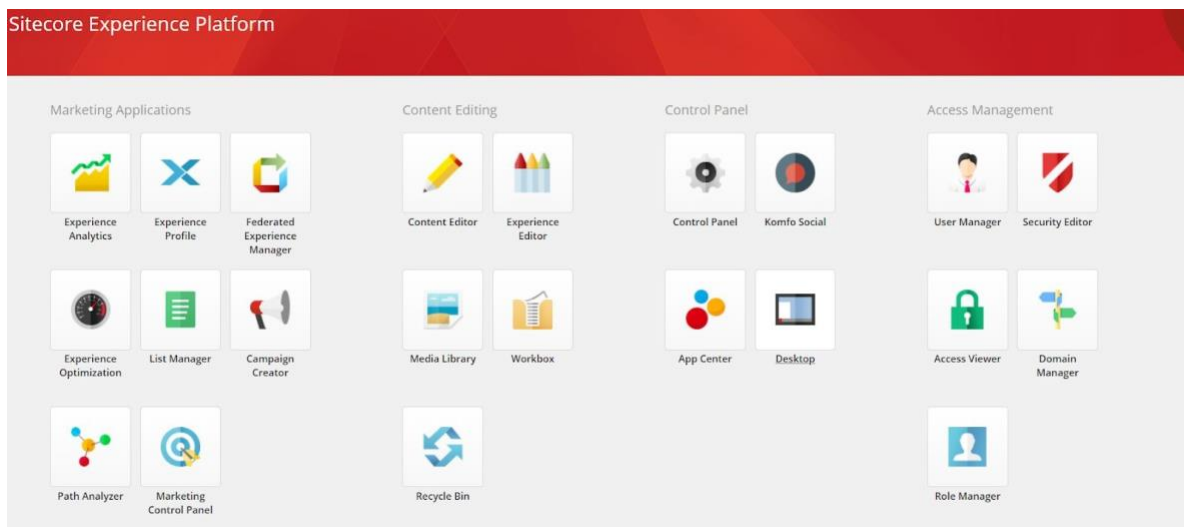

Sitecore configuration

The following configurations need to be applied on an 8.2.7, 9.0.2 or 9.1.0 version instance of Sitecore.

PACKAGE INSTALLATION

First, we need to install the Sitecore plugin for Sitecore DAM™ package in the Sitecore instance. The plugin package can be retrieved from the marketplace for the current version. In a scaled setup (multiple Sitecore instances), the user needs to copy files from the DAM installation package to all the Sitecore instances in the environment. The following steps describe the package installation.

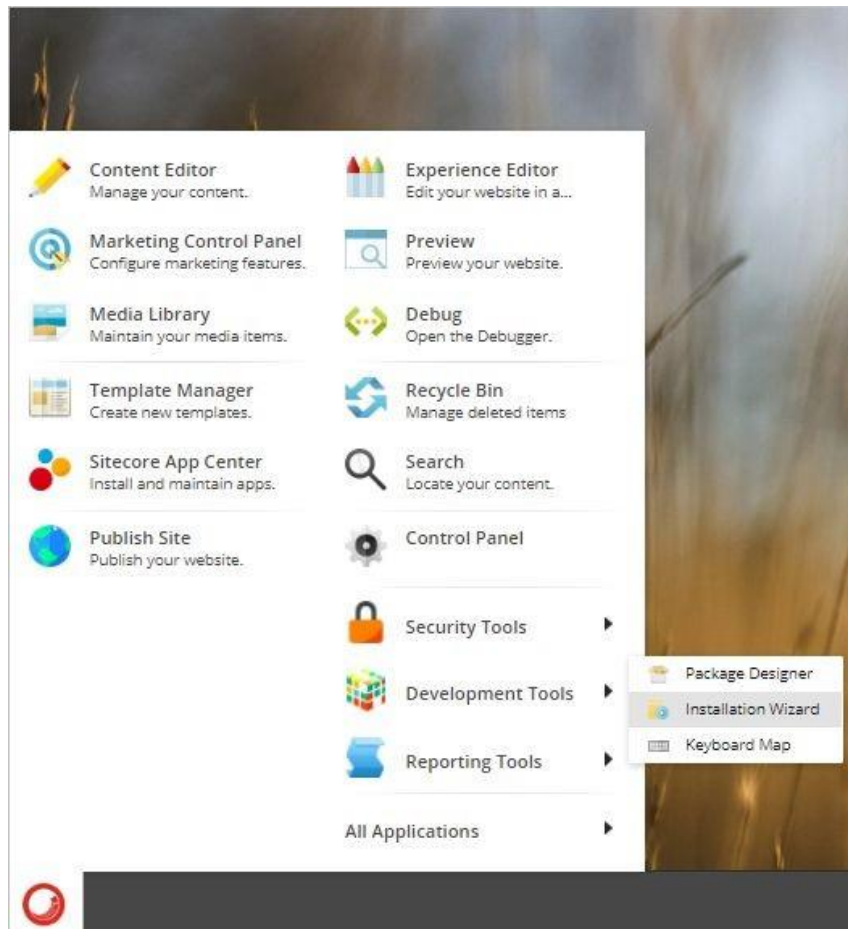

1. Log into the Sitecore instance by navigating to the corresponding URL (e.g. http://sitecore_instance_url/sitecore).
2. In the **Launchpad**, click on the **Desktop** icon.

The screenshot shows the Sitecore Experience Platform Launchpad. It features a red header with the text 'Sitecore Experience Platform'. Below the header, there are four main categories of applications: Marketing Applications, Content Editing, Control Panel, and Access Management. Each category contains several icons representing different tools and services.

Marketing Applications	Content Editing	Control Panel	Access Management
Experience Analytics, Experience Profile, Federated Experience Manager	Content Editor, Experience Editor	Control Panel, Komfo Social	User Manager, Security Editor
Experience Optimization, List Manager, Campaign Creator	Media Library, Workbox	App Center, Desktop	Access Viewer, Domain Manager
Path Analyzer, Marketing Control Panel	Recycle Bin	Role Manager	

3. In **Desktop**, click on **Home**.
4. Go to **Development tools** then click on **Installation wizard**.

5. In the **Install a package** dialog, select the plugin package then click on **Next**.

Install a Package

Select a package to install.

Name:

6. Verify the package information then click **Install**.

Install a Package

Verify the package information before you click install.

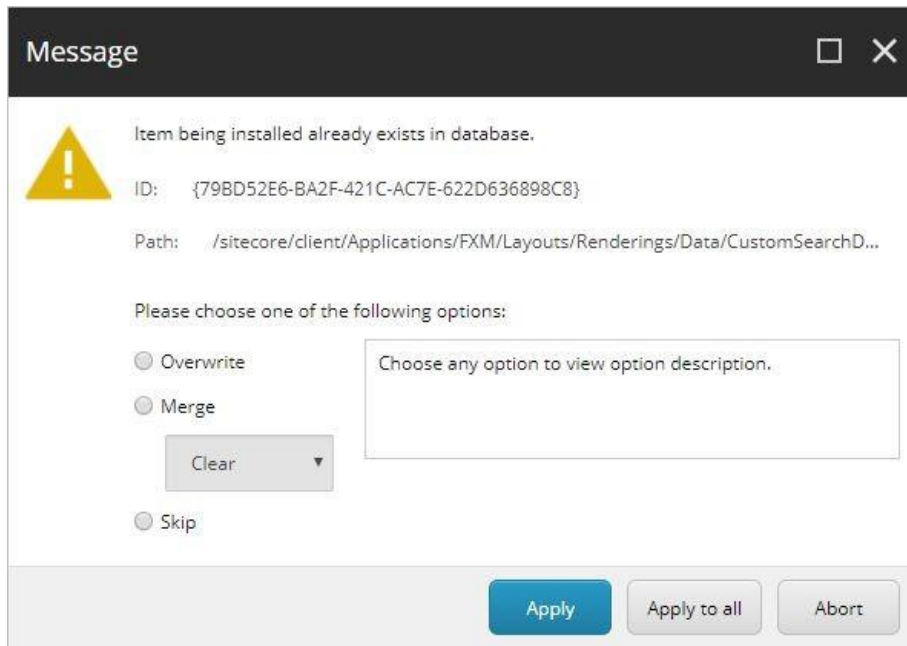

Package name:

Version:

Author:

Publisher:

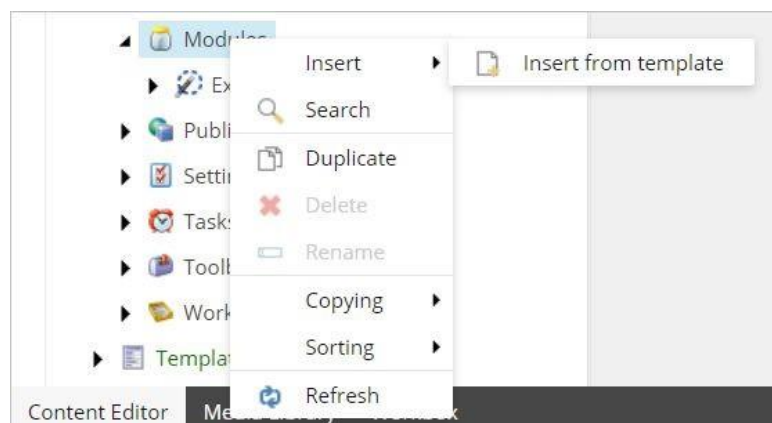

Note: The package installation might prompt the user with the message “Item being installed already exists in database”. In the case of a vanilla installation, the user can safely choose the overwrite option.

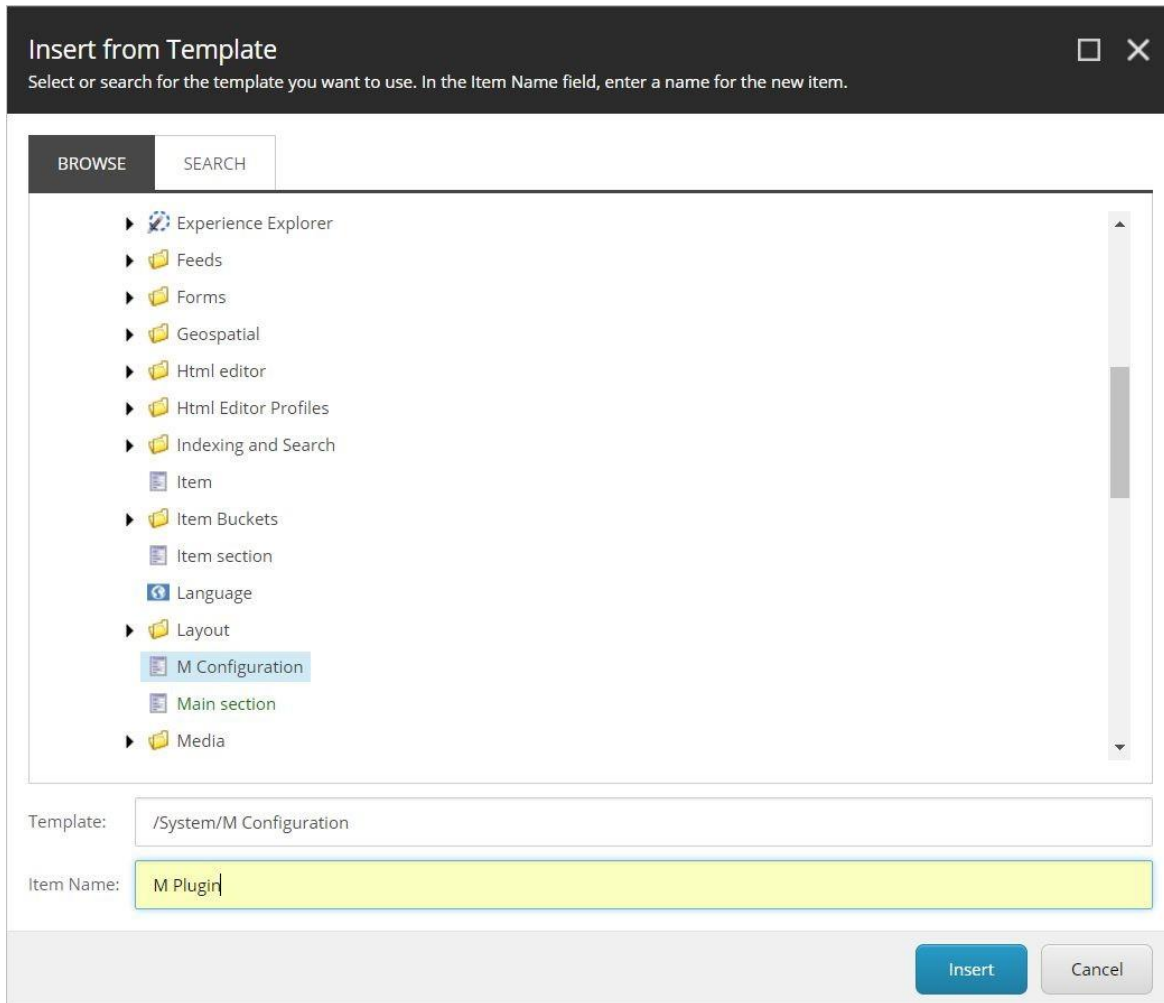

PACKAGE CONFIGURATION

After the package is successfully installed, we need to configure the plugin by providing the necessary information. The following steps describe the package configuration.

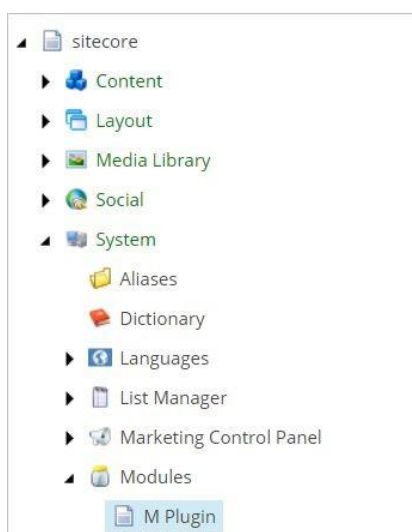

1. Go to **Content Editor**.
2. In the left-side menu, go to **Sitecore > System > Modules**.
3. Right click on **Modules**. then go to **Insert > Insert from template**.

4. In the **Insert from Template** window, select **M Configuration** under **System**, change the **Item Name** to “**M Plugin**” then click on **Insert**.

5. In the left-side menu, the **M Plugin** item should be available under **Modules**. Click on **M Plugin**.

6. Fill in the plugin parameters with information from the **OAuth** client (configured in the previous steps).

Data

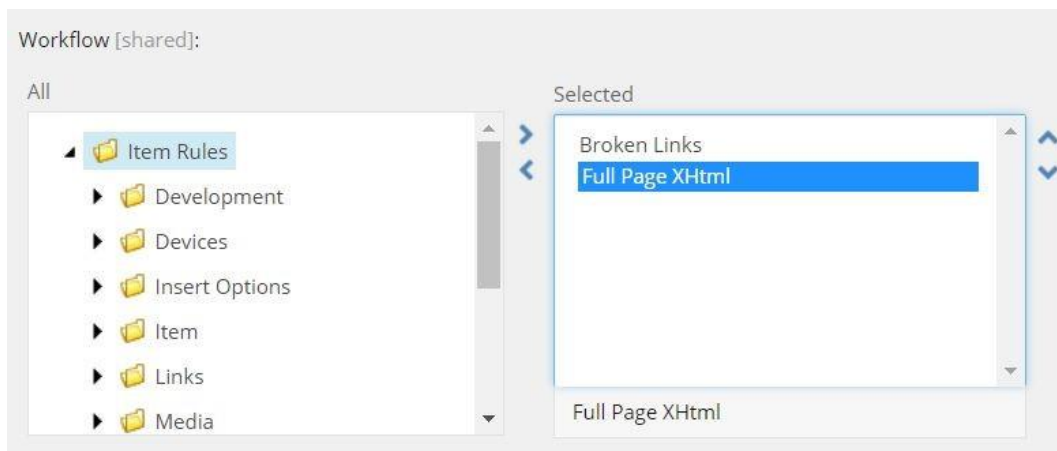

MInstance [shared]:
https://rsitest310.stylelabs.io

ClientId [shared]:
t1

SearchPage:
https://rsitest310.stylelabs.io/en-us/content

7. Save the changes.

Note: If using the version **8.2.7** of Sitecore, make sure to remove the **XHtml validation**. In the left-side menu, go to **Sitecore > System > Settings > Validation Rules > Global Rules**. In the main panel, under **Validation Rules**, scroll down to find the **Workflow** Item rules. Remove the **Full Page XHtml** item under **Selected**.

SERVER CONFIGURATION

For assets to be rendered in the Sitecore editor, add the following snippet to the sample rendering configuration file (an .xslt file found on the Sitecore host server \SitecoreROOT\Website\xsl\sample rendering.xslt).

```
<div class="contentDescription">  
  <sc:image field="image" />  
</div>
```

Plugin overview

The plugin works on the content and experience editor by extending two components: The Rich Text Editor and the Image Editor. The following steps describe how to use the plugin in the Sitecore instance, via the **M Content Search** window.

Starting M Content Search

Sitecore users can browse the different assets existing in Sitecore DAM™ using the M Content Search window via the Rich Text editor or the Image Editor.

RICH TEXT EDITOR

In the Rich Text component field, click on the **Show Editor** link to open the Rich Text Editor. Click on the Sitecore DAM™ icon (M) in the Rich Text Editor to open the M Content Search window.

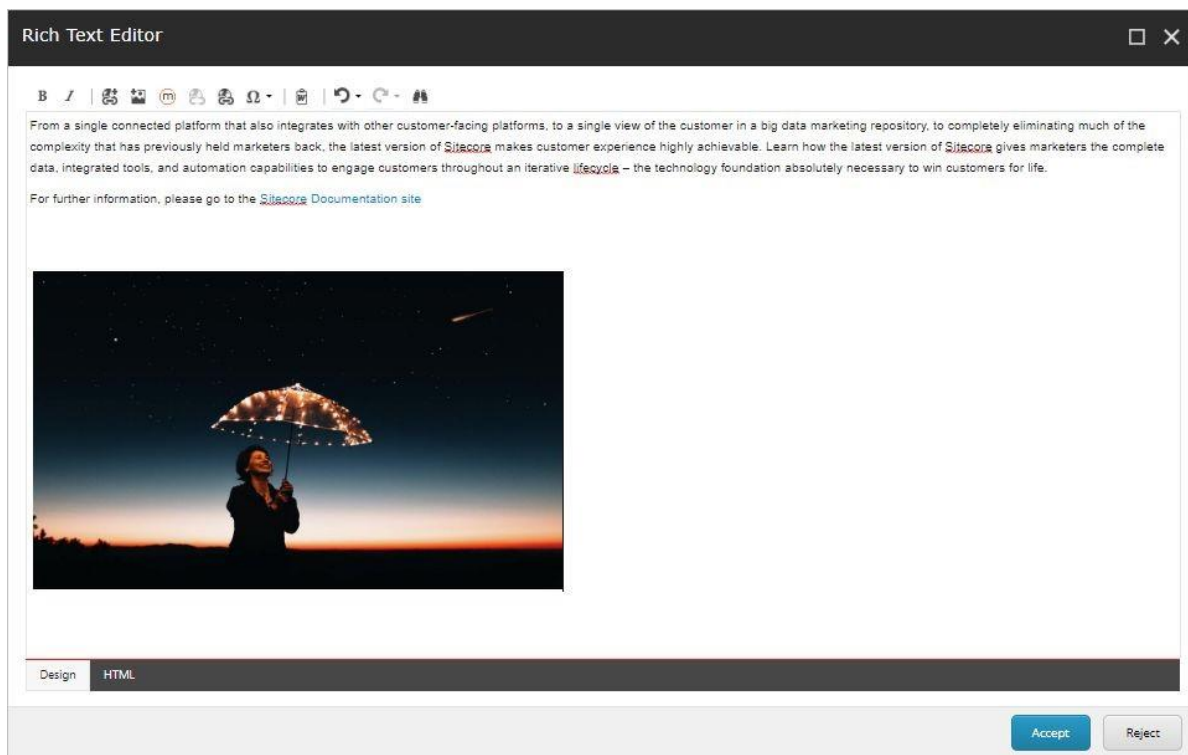

IMAGE EDITOR

In the Image Editor, click on the **Browse M** link to open the M Content Search window.

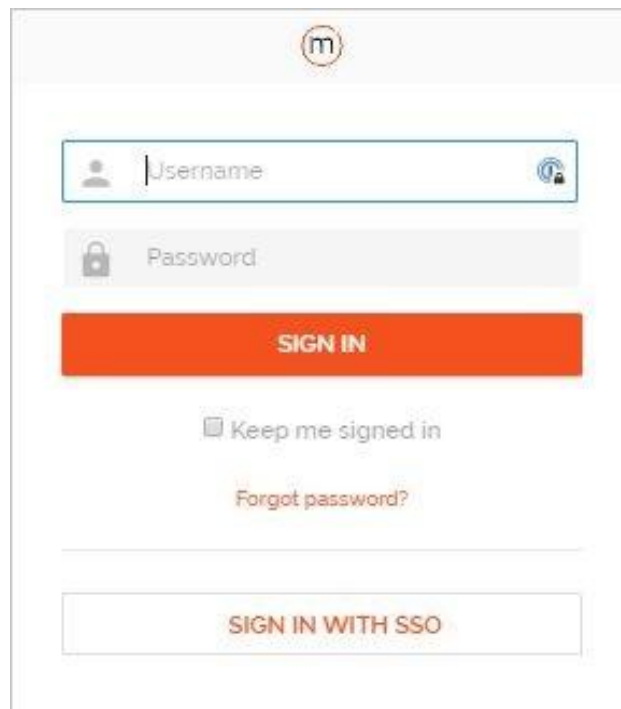

Using M Content Search

Using the M Content Search feature requires users to authenticate to Sitecore DAM™ before being able to use the assets.

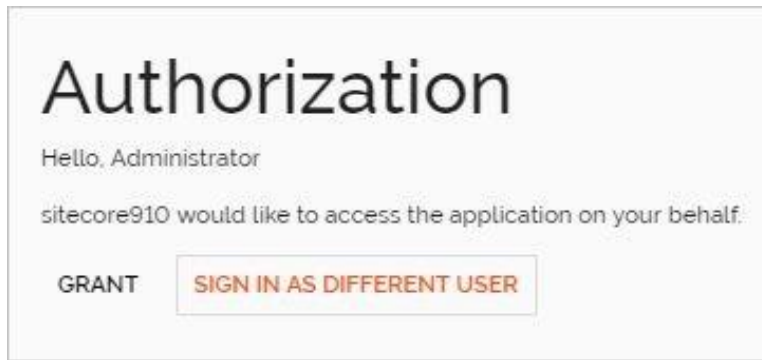

AUTHENTICATION

1. Provide the Sitecore DAM™ login credentials then sign in.

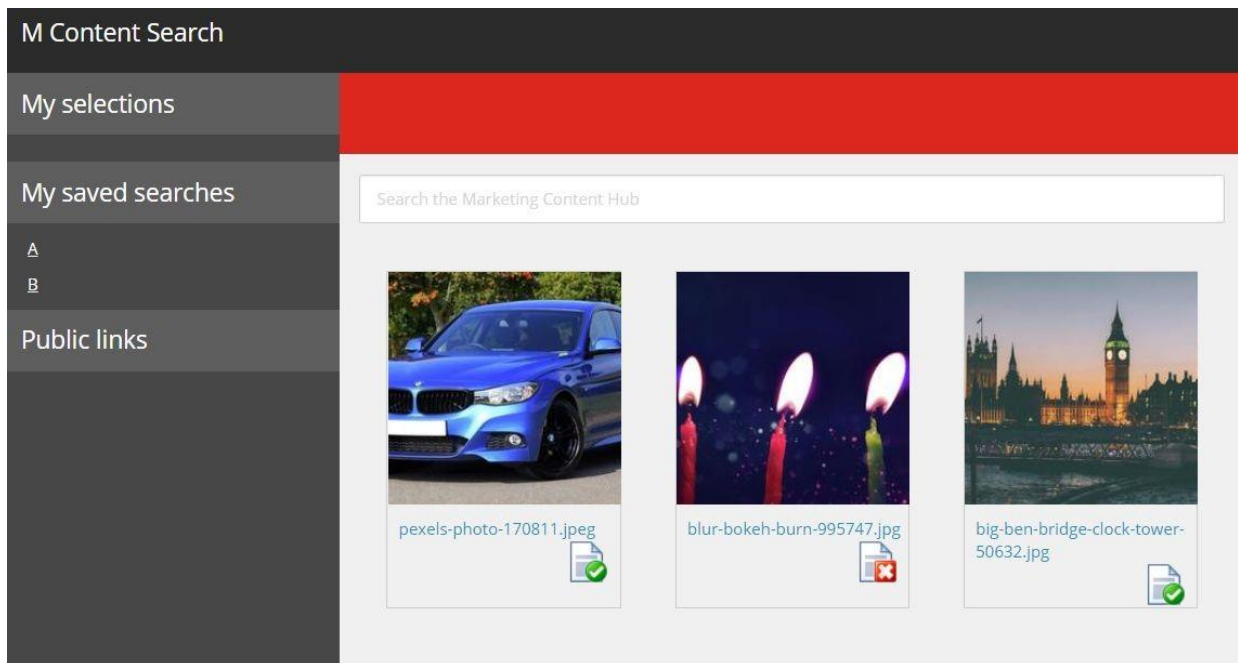

The screenshot shows the Sitecore DAM™ login form. At the top, there is a logo consisting of a lowercase 'm' inside a circle. Below the logo, there are two input fields: "Username" and "Password". The "Username" field has a user icon on the left and a lock icon on the right. The "Password" field has a lock icon on the left. Below the input fields, there is a prominent orange "SIGN IN" button. Underneath the button, there is a checkbox labeled "Keep me signed in" and a link labeled "Forgot password?". At the bottom of the form, there is a button labeled "SIGN IN WITH SSO".

2. **Authorize** the Sitecore access to Content Hub by clicking on **Grant**.

BROWSING M ASSETS

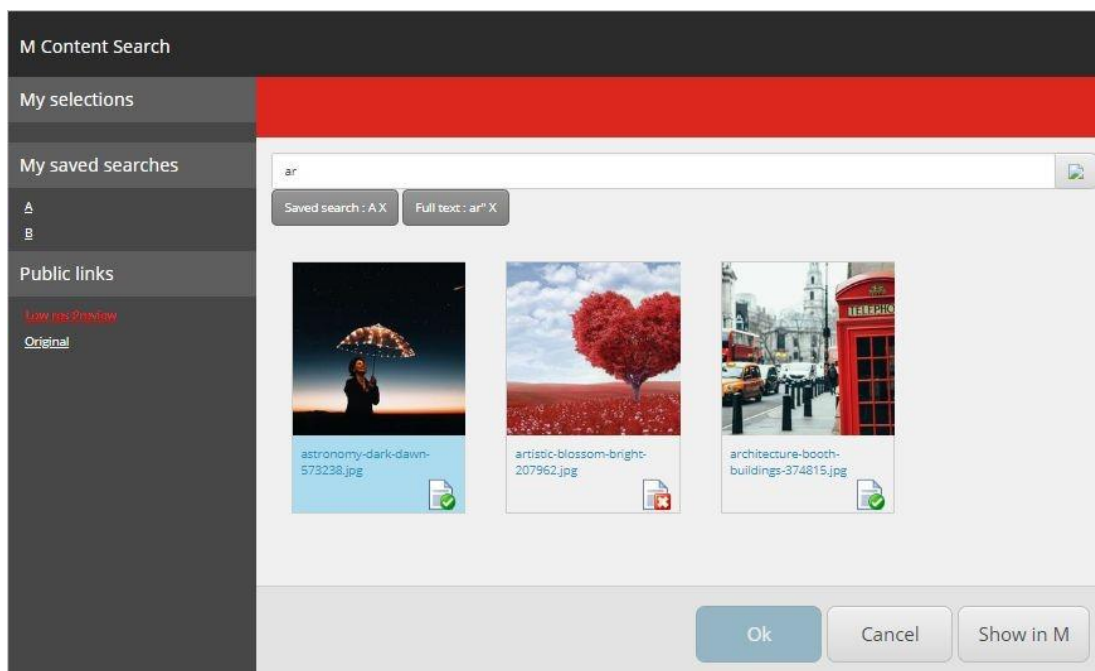

After granting the Sitecore access, the assets from Sitecore DAM™ will be available for search under M Content Search, along with the user's saved selections and saved searches. As shown in the following image, the assets with a public link are indicated by a green tick icon, as opposed to the assets with a red cross icon.

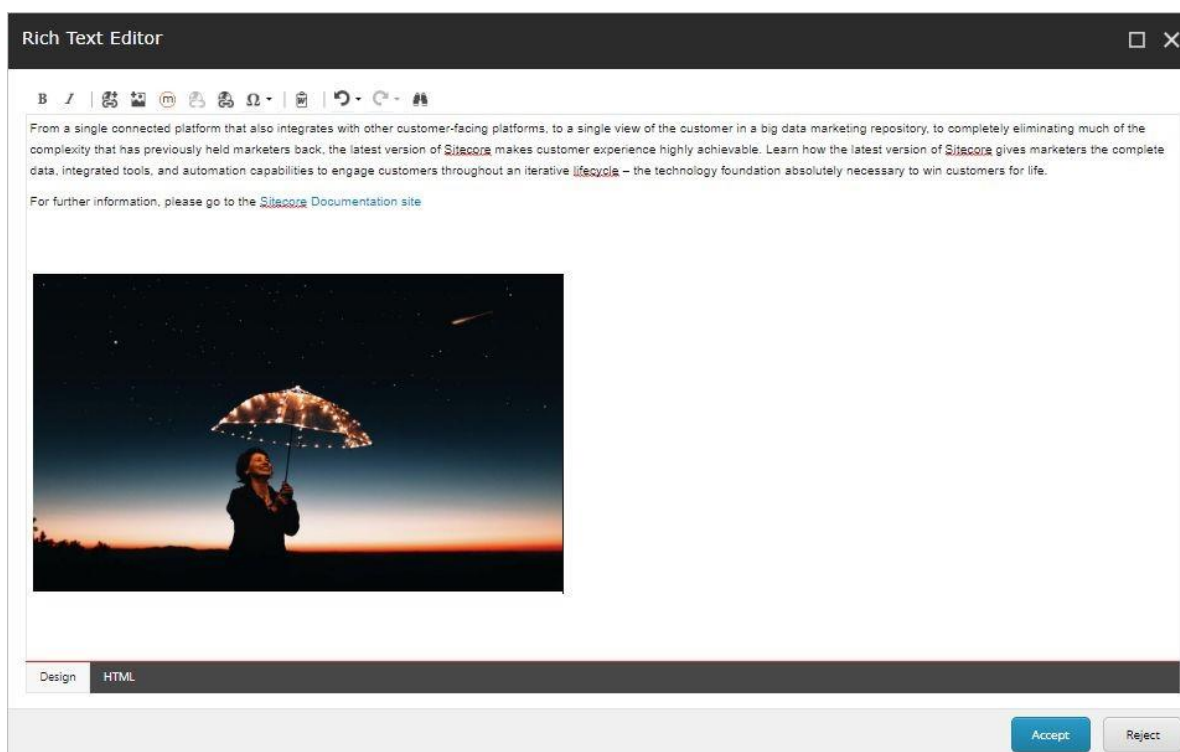

Note: Only assets with a public link can be used in Sitecore.

SELECTING AN ASSET

1. Clicking on the asset displays the available renditions in the side menu under **Public links**.
2. Clicking on the asset's title link redirects the user to the asset's Detail page in Sitecore DAM™.

3. Clicking on the **Show in M** button redirects the user to the search page in Sitecore DAM™.
4. After selecting a rendition link and clicking **Ok**, the corresponding asset becomes available in the editor (the Rich Text Editor or the Image Editor).

Note:

- For non-image assets (e.g. video files), a download link is inserted in the editor.
- In the Image Editor, users can't edit the images provided by Sitecore DAM™.

KNOWN ISSUES

- The Sitecore plugin might cause "404 Not Found" errors that can be seen on the browser's console. The errors have no functional impact.

Confidentiality
